

OFF LIMITS TOOLBOX

simple - efficient - user-friendly

With highly complex, automated client management solutions, a company can control complete network infrastructures - from the desktop to the individual user. By and large, the well-known software manufacturers lose sight of the small processes that make up the largest part of an IT administrator's daily work. However, it is not only the individual processes that cost your employees time. Nested structures, complicated menus - some of which do not exist - or queries with unnecessary functions make it difficult for employees to create their own to perform essential tasks

Our technicians, who mainly deal with the topic of „Client Management“, also encounter the daily problems an IT Admin encounters time and again. While in most companies „know-how“ or the necessary resources are not available, a service provider who lives the topic „client management“ must find a solution for these problems. From customer project to customer project, different approaches develop to make tasks easier, faster, more standardized and ultimately more cost-effective for the customer. In the course of time, best practices have been established which OFF LIMITS IT has carefully integrated into a single tool - the OFF LIMITS Toolbox - with a great deal of experience in many years of projects.

Special care has been taken to ensure the usability of the software and the functions behind it. The toolbox offers many „one-click“ functions that save an immense amount of time.

WIM UPDATER

The integrated Windows Image (WIM) Updater is used for effective and time-saving maintenance of Windows operating system images based on the command line application DISM provided by Microsoft. It is able to greatly reduce the effort of the update process by automating and simplifying many sub-processes. In addition, after selecting the.wim file, all updates are automatically listed with a click and, if desired, downloaded and integrated into the image. The Update Manager is the core module of the program. It is used to select, download and integrate updates, backup and manage the language packs. Additionally, the Update Manager includes a DSM mode, which is able to read from the DSM security holes of a client and fix them directly in an image.

THE DSM MANAGEMENT CENTER ...

... was specially tailored to the needs of an IT admin to serve the Ivanti DSM. Important routine administrative tasks can be performed here at the push of a button. Among other things, it concerns the complete maintenance processes of patches. In less than 5% of the usual time, failed patches can be reinstalled, patches deleted and updated.

INTEGRATED HELPDESK FEATURES

IT administrators who are not familiar with the DSM interface always have the problem of finding important core functions.

Integrated features that extend the DSM functions allow servers and DMZ servers with all required groups and functions to be set up easily or to perform a database consistency check. The toolbox is limited to essential elements, bundles several DSM functions and offers them in a clear, high-performance and intuitive interface.

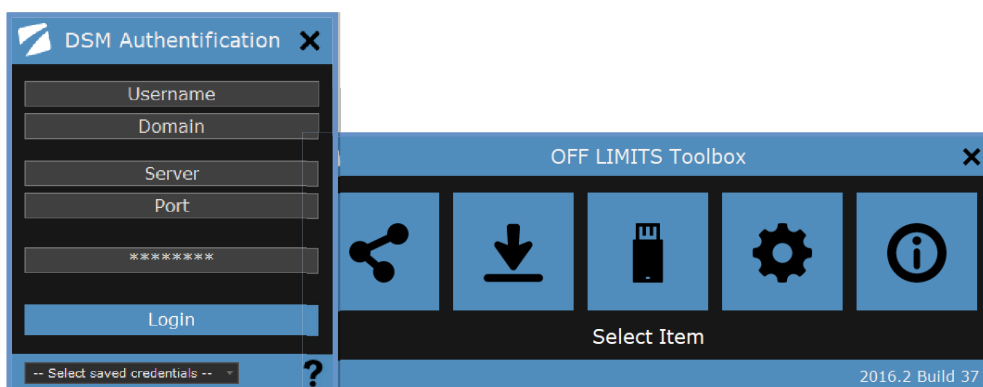

KEY BENEFITS

- up to 5x faster Microsoft Office basic installation
- up to 5x faster Microsoft Office update routine
- DSM maintenance processes from patch up to 20x faster
- time-saving maintenance of Windows operating system images
- integrated DSM mode for direct elimination of security holes in operating system images
- targeted one-click DSM Remote or RDP connection to clients
- clear, intuitive and high-performance user interface

ABOUT OFF LIMITS IT SERVICES

OFF LIMITS IT Services GmbH is a consulting and IT services company that offers you tailor-made IT solutions from a single source.

As an IT service provider, OFF LIMITS IT Services GmbH is primarily active in the areas of consulting and conception, implementation and integration.
